fetch_all.py

```python
import asyncio
import httpx

async def fetch(client, url):
    r = await client.get(url, timeout=10)
    r.raise_for_status()
    return r.json()

async def main(urls):
    async with httpx.AsyncClient() as client:
        async with asyncio.TaskGroup() as tg:
            tasks = [tg.create_task(fetch(client, u)) for u in urls]
    return [t.result() for t in tasks]

# one failure cancels the rest: no orphaned tasks
```

DEV #python · 3h

Structured concurrency in Python: replacing gather() with TaskGroup

TaskGroup cancels sibling tasks the moment one fails, which removes a whole class of orphaned-task bugs. A walkthrough of migrating a 40k-line service, and the three places it broke.

Reddit r/kubernetes · 5h

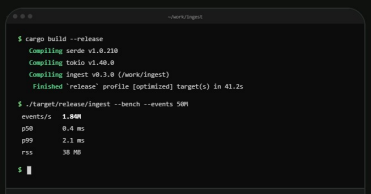

Pods went into CrashLoopBackOff after a node upgrade. The culprit was a 1-second liveness probe

Slower cold starts on the new nodes pushed /healthz past the timeout, so the kubelet kept killing healthy pods.

The case for boring CI: shell scripts over YAML

If your pipeline can't run on a laptop, you can't debug it.

Which standard library module do you wish you'd found sooner?

Mine is functools.cache alone replaced a hand-rolled memoizer in three projects.

Multi-region failover on AWS without doubling your bill

A warm standby with one app instance and an async Postgres replica, plus DNS health checks, got recovery under five minutes for a fraction of what active-active costs.

Parallel test sharding cut our pipeline from 22 to 6 minutes

Four pytest shards, a warm dependency cache, and e2e running beside the unit tests.
